S5 Figure: Cao-extension Posterior Diagnostics

Candidate number: 1102384

Figure S5 shows the allocation coordinates from the qualified hierarchical-allocation extension and participant-specific effective male contributions. Both complete posterior fits met the predefined whole-model MCMC criteria.

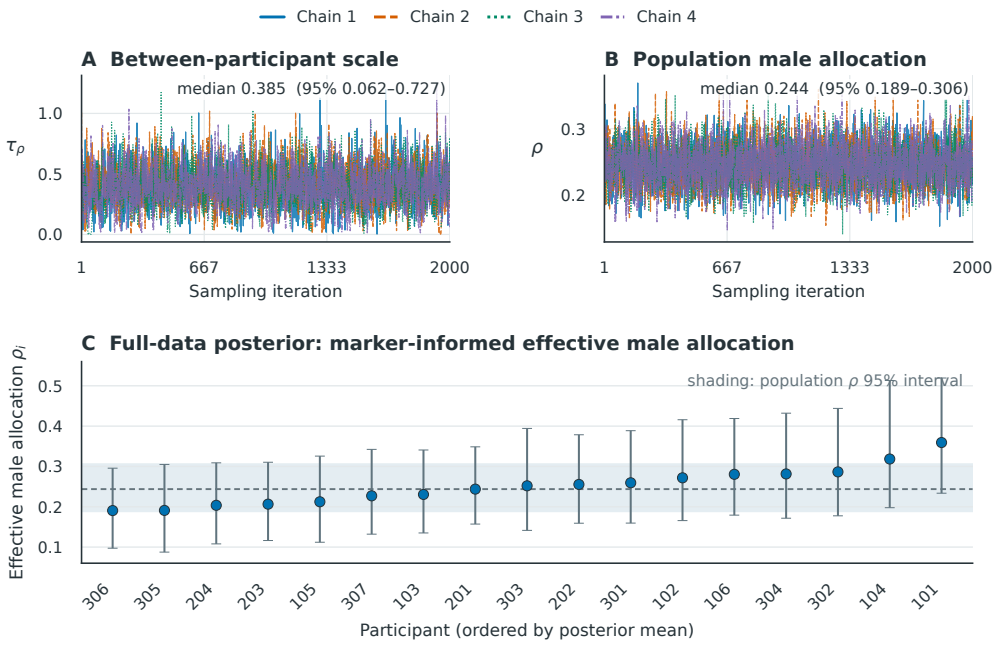

Figure S5: Allocation-hierarchy posterior diagnostics. Traces show the qualified hierarchical-allocation extension posterior and use colour and line style to identify chains. Participant intervals are from the full-data posterior and ρ_i is marker-informed, not a directly measured cell sex ratio. For the global-allocation comparator and hierarchical-allocation extension, respectively, maximum $\widehat{R}$ was 1.00370 and 1.00559, minimum bulk effective sample sizes were 1484.19 and 758.659, minimum tail effective sample sizes were 2770.49 and 1339.05, and minimum energy Bayesian fractions of missing information were 0.7134 and 0.7520. Both fits had zero divergences and zero maximum-depth transitions.
